The \texttt{amsgen} package

American Mathematical Society
Michael Downes

Version 2.0, 1999/11/30

1 Introduction

This is an internal package for storing common functions that are shared by more than one package in the \texttt{AMSLaTeX} distribution. Some of these might eventually make it into the \LaTeX{} kernel.

Standard package info. Using \texttt{\ProvidesFile} rather than \texttt{\ProvidesPackage} because the latter, when input by, e.g., \texttt{amsbook}, results in \LaTeX{} warning: You have requested document class ‘amsbook’, but the document class provides ‘amsgen’.

\texttt{\NeedsTeXFormat{LaTeX2e}}% LaTeX 2.09 can’t be used (nor non-LaTeX)
[1994/12/01]% LaTeX date must December 1994 or later
\texttt{\ProvidesFile{amsgen.sty}[1999/11/30 v2.0]}

2 Implementation

Some general macros shared by \texttt{amsart.dtx}, \texttt{amsmath.dtx}, \texttt{amsfonts.dtx}, \ldots

\texttt{\@saveprimitive} The \texttt{amsmath} package redefines a number of \TeX{} primitives. In case some preceding package also decided to redefine one of those same primitives, we had better do some checking to make sure that we are able to save the primitive meaning for internal use. This is handled by the \texttt{\@saveprimitive} function. We follow the example of \texttt{\@@input} where the primitive meaning is stored in an internal control sequence with a \texttt{@@} prefix. Primitive control sequences can be distinguished by the fact that \texttt{\string} and \texttt{\meaning} return the same information.

\texttt{\providecommand{\@saveprimitive}[2]{{\begingroup\escapechar'\relax
\edef\@tempa{\string#1}\edef\@tempb{\meaning#1}%
\ifx\@tempa\@tempb \global\let#2#1%
\else
\latex@error{Unable to properly define \string#2; primitive
}}}}

Check to see if \texttt{#2} was already given the desired primitive meaning somewhere else.

\texttt{\edef\@tempb{\meaning#2}%
\ifx\@tempa\@tempb
\else
\latex@error{Unable to properly define \string#2; primitive
}}
Shorthands for long command names.

\let\@xp=\expandafter
\let\@nx=\noexpand

\@emptytoks A token register companion for \@empty. Saves a little main mem and probably makes initializations such as \toks@{} run faster too.

\newtoks\@emptytoks

\@oparg Use of \@oparg simplifies some constructions where a macro takes an optional argument in square brackets. We can’t use \newcommand here because this function might be previously defined by the amsmath package in a loading sequence such as

\usepackage{amsmath,amsthm}

\def\@oparg#1[#2]{\@ifnextchar[{{#1}{#1[#2]}}

\@ifempty \@ifnotempty \@ifnotempty use category 11 @ characters to test whether the argument is empty or not, since these are highly unlikely to occur in the argument. As with \@oparg, there is a possibility that these commands were defined previously in amsmath.sty.

\long\def\@ifempty#1{{\@ifempty#1\@
il}}
\long\def\@ifnotempty#1[#2]{{\@ifempty{#1}{}{#2}}}

\@ifnotempty is a shorthand that makes code read better when no action is needed in the empty case. At a cost of double argument-reading—so for often-executed code, avoiding \@ifnotempty might be wise.

\long\def\@ifnotempty#1{{\@ifempty{#1}{}{#1}}}

Some abbreviations to conserve token mem.

\def\FN@{\futurelet\@let@token}
\def\DN@{\def\next@}
\def\RIfM@{\relax\ifmmode}
\def\setboxz@h{\setbox\z@}
\def\wdz@{\wd\z@}
\def\boxz@{\box\z@}
\def\relaxnext@{\let\@let@token\relax}

\new@ifnextchar This macro is a new version of \LaTeX’s \ifnextchar, macro that does not skip over spaces.

\long\def\new@ifnextchar#1#2#3{%
2. IMPLEMENTATION

By including the space after the equals sign, we make it possible for `\new@ifnextchar` to do look-ahead for any token, including a space!

\begin{verbatim}
\let\reserved@d= #1%
\def\reserved@a{#2}\def\reserved@b{#3}%
\futurelet\@let@token\new@ifnch
%
\def\new@ifnch{%
  \ifx\@let@token\reserved@d \let\reserved@b\reserved@a \fi
\reserved@b
\reserved@b
\end{verbatim}

There will essentially never be a space before the *, so using `\@ifnextchar` is unnecessarily slow.

\begin{verbatim}
\def\@ifstar#1#2{{\new@ifnextchar *{\def\reserved@a*{#1}\reserved@a}{#2}}
\end{verbatim}

The hook `\every@size` was changed to `\every@math@size` in the December 1994 release of \LaTeX{} and its calling procedures changed. If `\every@math@size` is undefined it means the user has an older version of \LaTeX{} so we had better define it and patch a couple of functions (`\glb@settings` and `\set@fontsize`).

\begin{verbatim}
\ifundefined{every@math@size}{{% Reuse the same token register; since it was never used except for the purposes that are affected below, this is OK.
\let\every@math@size=\every@size
\def\glb@settings{%
  \expandafter\ifx\csname S@f@size\endcsname\relax
    \calculate@math@sizes
  \fi
  \csname S@f@size\endcsname\ifmath@fonts
% \ifnum \tracingfonts>\tw@
%   \@font@info{Setting up math fonts for \f@size/\f@baselineskip}\fi
\begingroup
  \escapechar\m@ne
  \csname mv@math@version \endcsname
  \globaldefs\one
  \let \glb@currsize \f@size
  \math@fonts
\endgroup
  \the\every@math@size
  \else
% \ifnum \tracingfonts>\tw@
%   \@font@info{No math setup for \f@size/\f@baselineskip}\%
% \fi
  \fi
}\endgroup
\else

\end{verbatim}
Remove `\every@size` from `\size@update`.

```latex
\def\set@fontsize#1#2#3{%
  \@defaultunits\@tempdimb#2pt\relax\@nnil
  \edef\f@size{\strip@pt\@tempdimb}%
  \@defaultunits\@tempskipa#3pt\relax\@nnil
  \edef\f@baselineskip{\the\@tempskipa}%
  \edef\f@linespread{#1}%
  \let\baselinestretch\f@linespread
  \def\size@update{%
    \baselineskip\f@baselineskip\relax
    \baselineskip\f@linespread\baselineskip
    \normalbaselineskip\baselineskip
    \setbox\strutbox\hbox{\vrule\@height.7\baselineskip
    \@depth.3\baselineskip
    \@width\z@}%
  }%
  \let\every@size\relax}
}
```

The `\ex@` variable provides a small unit of space for use in math-mode constructions, that varies according to the current type size. For example, the `\pmb` command uses `\ex@` units. Since a macro or mu unit solution for the `<dimen>` `\ex@` won't work without changing a lot of current code in the `amsmath` package, we set `\ex@` through the `\every@math@size` hook. The value of `\ex@` is scaled nonlinearly in a range of roughly 0.5pt to 1.5pt, by the function `\compute@ex@`.

```latex
\newdimen\ex@
\addto@hook\every@math@size{\compute@ex@}
```

`\compute@ex@` computes `\ex@` as a nonlinear scaling from 10pt to current font size (`\f@size`). Using .97 as the multiplier makes 1 `\ex@` ≈ .9pt when the current type size is 8pt and 1 `\ex@` ≈ 1.1pt when the current type size is 12pt.

The formula is essentially

\[ 1\text{pt} \pm (1\text{pt} - (0.97)^{|10-n|}) \]

where `n` = current type size, but adjusted to differentiate half-point sizes as well as whole point sizes, and there is a cutoff for extraordinarily large values of `\f@size` (> 20pt) so that the value of `\ex@` never exceeds 1.5pt.

```latex
\def\compute@ex@{%
  \begingroup
  \dimen0=-\f@size\p@
  \ifdim\dimen0<-20\p@
    \global\ex@ 1.5\p@
    \else
```
Adjust by the reference size and multiply by 2 to allow for half-point sizes.
\begin{verbatim}
\advance\dimen@10\p@ \multiply\dimen@\tw@
\end{verbatim}

Save information about the current sign of \dimen@.
\begin{verbatim}
\edef\@tempa{\ifdim\dimen@\z@ -\fi}
\end{verbatim}

Get the absolute value of \dimen@.
\begin{verbatim}
\dimen@ \ifdim\dimen@\z@ -\fi \dimen@
\advance\dimen@\m sp \v@fuzz fudge factor
\end{verbatim}

Here we use \v@fuzz merely as a convenient scratch register
\begin{verbatim}
\v@fuzz\p@
\end{verbatim}

Multiply in a loop.
\begin{verbatim}
\def\do{\ifdim\dimen@\z@
\v@fuzz=.97\v@fuzz
\advance\dimen@-\p@}
%\message{\v@fuzz: \the\v@fuzz, \dimen@: \the\dimen@}%
\@xp\do \fi}
\do
\dimen@\p@ \advance\dimen@-\v@fuzz
\global\ex@\p@
\global\advance\ex@\@tempa\dimen@
\fi
\endgroup
%\typeout{\string\f@size: \f@size}\showthe\ex@
\end{verbatim}

Tests of the \compute@ex@ function yield the following results:

\begin{verbatim}
\f@size \ex@ \f@size \ex@
10 1.0pt 9 0.94089pt
11 1.05911pt 8.7 0.91266pt
12 1.11473pt 8.5 0.91266pt
14.4 1.23982pt 8.4 0.88527pt
17.28 1.36684pt 8 0.88527pt
20.74 1.5pt 7 0.83293pt
19.5 1.4395pt 6 0.78369pt
5 0.73737pt
1 0.57785pt
\end{verbatim}

\@addpunct Use of the \@addpunct function allows ending punctuation in section headings
and elsewhere to be intelligently omitted when punctuation is already present.
\begin{verbatim}
\def\@addpunct#1{\ifnum\spacefactor\z@ \else#1\fi}
\end{verbatim}

\frenchspacing Change \frenchspacing to ensure that \@addpunct will continue to work prop-
erly even when ‘french’ spacing is in effect.
\begin{verbatim}
\frenchspacing
\def\frenchspacing{
\sfcode'.'1006\sfcode'?1005\sfcode'!1004%
\sfcode'\:1003\sfcode'\;1002\sfcode','1001 }
\end{verbatim}
\def\nomath@env{@amsmath@err{\string\begin{@currenvir} allowed only in paragraph mode\}@ehb% "You've lost some text"}

A trade-off between main memory space and hash size; using `Invalid@@` saves 14 bytes of main memory for each use of `Invalid@`, at the cost of one control sequence name. `Invalid@` is currently used about five times and `Invalid@@` is used by itself in some other instances, which means that it saves us more memory than `FN@`, `RIfM@`, and some of the other abbreviations above.

\def\Invalid@@{Invalid use of \string}

The usual `\endinput` to ensure that random garbage at the end of the file doesn’t get copied by `docstrip`.

`\endinput`
