Using LuaLaTeX to typeset RTL text with eledpar

Abstract

This file provides an example on how to use eledpar and LuaLaTeX to typeset a right to left text with its translation on the facing page.\footnote{The text was provided by Latechneuse on \url{http://tex.stackexchange.com/q/227837/7712}.

As you can see, the switch to RTL convention is made before the pstart. It must be also called inside \eledsection. For an example with XeLaTeX, look at parallel-column-two-languages.tex file.
